playbook docs · model moss-minilm

Metric	Value
Scam scenarios detected (reached DANGER)	100%
Benign scenarios wrongly escalated to DANGER	0%
Scam family identified correctly	90%
Mean turn at which DANGER fired	3.9
Retrieval latency p50 / p95 / p99 (ms, end-to-end incl. embedding)	8.01 / 14.95 / 18.55
Mean engine-reported search time (ms)	8.25
Utterances analysed	264
Benign everyday fragments (not in the index) credited with any tactic	1 / 80 (1.3%)
Hardware	Intel(R) Xeon(R) Processor @ 2.10GHz × 4 vCPU, embedding threads 2

Scenario counts: 10 scam calls, 8 genuine calls. Latency is wall-clock around `retriever.search()` (query embedding + multi-index cosine search + metadata decode); it excludes speech-to-text and network. See `docs/eval/latency.json` (`npm run eval:bench`) for the dedicated benchmark.

Limitations. Scenarios are scripted reconstructions paraphrased from public advisories, not recordings of real calls; accents, background noise and speech-recognition errors are not modelled here (the live-microphone mode exercises them). The benign fragment set is small (80 sentences) and English/Hinglish only.

Benign fragments that were credited (to fix next):

- "I'm at the bank branch, the queue is long but moving." → `verification_bypass`, authority (top match 0.551: "Please don't visit the branch, the branch KYC queue takes 15 days. Thi")

Scenarios
